

Integrated Web System & Portal

Revised Full Scope & Requirements

TypeScript stack & real-time updates

Version 6 | Based on Full Scope v5 | For review

Non-Technical Client Version

Feature Purpose

Required Revisions

Delivery Boundaries

Purpose of this revision

This document keeps the business goals of the original requirements, but replaces items that are risky, contradictory, unnecessary for Version 1, or no longer match the agreed workflow.

■ Red strikethrough — do not implement as written

■ Green — recommended replacement

■ Blue — explanation / client action

Prepared for discussion and final scope sign-off

Document Control

Field	Detail
Project	Fresh Phones PH Integrated Web System
Document	Revised Full Scope & Requirements
Basis	Initial Requirements – August 2026 + subsequent operational clarifications
Primary delivery	Responsive web system for customers and internal employees
Estimated SDLC timeline	Approximately 4–6 months for the revised core system
Status	For client review, legal/privacy review, and final sign-off

Important: This is a software scope document, not legal, tax, accounting, or labor advice. Privacy, employment, and BIR wording should be reviewed by Fresh Phones PH's lawyer, accountant, and/or Data Protection Officer before production use.

Revision legend: **RED + STRIKETHROUGH** = remove or do not implement as written. **GREEN** = recommended replacement. **BLUE** = explanation / client action.

Revision 1.5 | September 7, 2026

Version 6 updates the TypeScript frontend/backend architecture in section 15 and adds real-time behavior, access controls, recovery and acceptance checks in sections 15.1-15.2. This remains a scope document for review and sign-off; it does not report completed implementation. Other scope provisions and the dated commercial estimates are carried forward from Version 5.

Contents

1. Executive Summary	12. Notifications
2. Revised Product Vision	13. AI Assistant & Automation
3. Users and Role Access	14. Privacy, Documents & Compliance
4. Public Website	15. TypeScript & Real-Time Updates
5. Customer Portal	16. Security Requirements
6. Paluwagan Records & Client Management	17. SDLC & Estimated Timeline
7. Payment Recording & Finance Verification	18. Scope Revisions – What Changes and Why
8. Employee Tasks, Deadlines & KPI	19. Out of Scope / Future Phase
9. Reporting & Analytics	20. Commercial & Subscription Boundaries
10. Customer Service	21. Acceptance, Handover & Change Control
11. Recruitment & Agent Verification	
A. Recommended Data Fields	
B. Compliance Reference Notes	

Section 15 now includes the production stack (p. 18), live-update behavior (p. 19), and controls and acceptance checks (p. 20).

1 Executive Summary

Fresh Phones PH needs one centralized web system that helps the business manage Paluwagan clients, batches, payment records, customer documents, employee tasks, finance verification, reports, customer concerns, recruitment, and agent verification. The system should reduce reliance on scattered spreadsheets and Messenger history while keeping the current customer payment process familiar.

Key operational decision: customers will NOT pay directly inside the website. Payment coordination remains in the Messenger Group Chat or other Fresh Phones PH-designated external channels. The web system records and verifies the payment afterward.

Step	What happens	Why it matters
1	Client communicates/pays through Messenger GC or designated channel	Keeps the current payment behavior; no forced online checkout.
2	Authorized staff records the payment inside the system	Creates one official internal operational record.
3	Finance verifies the record and proof/reference	Prevents unverified entries from changing balances.
4	Customer portal shows verified payment history and balance	Gives clients transparency without processing money in the site.

2 Revised Product Vision

The system should be understood as a business operations and records platform — not an online payment gateway, not a BIR POS, and not an autonomous HR decision-maker.

THE SYSTEM SHOULD BE

- A centralized client and employee portal
- A source of truth for batches and verified payments
- A secure document and records repository
- A task and reporting tool
- A role-based management dashboard
- A customer status and support portal

THE SYSTEM SHOULD NOT BE

- An online checkout/payment processor in V1
- A substitute for Fresh Phones PH's BIR-compliant invoicing process
- A system that automatically deducts salaries
- An AI that independently decides HR/finance actions
- A public repository of customer or employee data

3 Users and Role Access

Every employee receives an individual account. What a person can see or change depends on their assigned role. This protects confidential information and makes it easier to trace who changed a record.

Role	Access in simple terms	Purpose
Owner	High-level business oversight; authorized access to management, finance, HR/KPI, records, analytics and reports.	Overall decision-making and visibility.
COO	Broad operations, tasks, reports and monitoring. Confidential HR/payroll details only if separately approved.	Day-to-day operational oversight.
General Manager	Operations, task designation, late submissions and management reports.	Manage teams without automatically exposing payroll/confidential HR data.
HR / Payroll	Employee records, payroll-related submissions, KPI reviews and approved HR actions.	Keep employee information within the proper team.
Finance Officer	Payment records, proof/reference verification, finance reports and status updates.	Control who can verify money-related records.
Records & Monitoring	Paluwagan batches, client records, client requirements and documents.	Maintain accurate client and batch information.
Analytics	Authorized summaries, reports, trends and recommendations. Prefer aggregated data where possible.	Turn records into useful management information.
Customer Service Head / Team	Customer concerns, assignment, resolution, status and reports.	Centralize support and response tracking.
Core Team / Handlers	Only the modules and records related to assigned work.	Apply least-privilege access instead of giving broad system access.

4

Public Website

The public side explains Fresh Phones PH and lets people find information without needing an employee account.

Feature	What the user can do	Why it is useful
Paluwagan unit catalog	Browse currently offered phone/unit models and basic availability information.	Reduces repeated inquiries and gives clients a clear starting point.
Payment breakdown	View sample payment schedules and expected installments for each offer.	Sets expectations before a client joins.
How It Works	See a simple step-by-step Paluwagan process.	Makes the process easier for first-time clients to understand.
Requirements	See the documents and information required for enrollment.	Helps clients prepare before submitting.
FAQs	Search common questions by topic.	Reduces repetitive support questions.
Agent verification	Check whether a person is currently recognized as a Fresh Phones PH agent.	Helps reduce impersonation/fraud risk.
Careers	View available openings and submit a job application.	Centralizes recruitment instead of relying only on social messages.
Customer login	Enter the secure customer portal.	Separates public information from private account information.
Support entry point	Start or follow a customer concern after login.	Gives support requests a trackable status.

5

Customer Portal

The customer portal is for visibility and document/status tracking. It does not process the customer's payment in Version 1.

Feature	What the user can do	Why it is useful
Secure account	Sign in and view only the customer's own account.	Protects private records from other clients.
Paluwagan membership	View assigned batch number, unit/model and key dates.	Keeps the customer informed about their enrollment.
Payment schedule	View due dates, expected amounts, verified amount paid and remaining balance.	Lets the customer understand what is still due.
Verified payment history	View payments that Finance has approved, including date, amount, method/reference and status.	Creates transparent payment history without turning the website into a payment processor.
Requirements/documents	Upload or view permitted requirements through private storage.	Reduces lost files and keeps requirements attached to the correct client.
Release/fulfillment status	View the current unit/order release status.	Reduces repeated "status update" inquiries.
Customer support	Create a concern and monitor its progress/resolution.	Makes follow-up easier for both customer and CS team.
Notifications	Receive relevant reminders or status updates.	Keeps the client informed without exposing internal information.

6

Paluwagan Records & Client Management

This module becomes the core source of truth for active batches and clients.

Feature	What the user can do	Why it is useful
Batch management	Create a batch, assign a unique batch number, unit/ model, status, dates and handler/agent.	Prevents duplicate or unclear batch records.
Client records	Attach each member to the correct batch and store approved client information.	Keeps customer history organized.
Requirements checklist	Track which documents or information are complete, missing, approved or need clarification.	Shows staff exactly what still needs action.
Private document storage	Store IDs, photos and supporting files with access restrictions.	Protects sensitive information and avoids public file links.
Payment schedule & balance	Track expected installments and balance based on verified payment records.	Provides consistent balances across Finance, Records and customer portal.
Edit history	Record important changes, who made them and when.	Supports accountability when records are corrected.
Search/filter	Filter by batch, client, unit, agent, status or date.	Makes large records easier to manage.

7 Payment Recording & Finance Verification

Revised based on the confirmed workflow: clients pay outside the website, normally through arrangements made in the Messenger Group Chat. The system starts its job when the business records that payment.

OLD /
REMOVE

~~Online payment gateway or customer payment directly inside the website.~~

REVISED

External payment + internal recording + Finance verification. No Stripe/PayMongo/Maya checkout integration in Version 1 unless the business later changes its process.

WHY

This matches the actual operation, reduces development complexity, avoids unnecessary gateway fees/integration, and keeps the system focused on accurate records.

7.1 Finance Payment Features

Feature	What the user can do	Why it is useful
Create payment record	Authorized staff selects the client/batch and records amount, date, payment method, reference number and optional proof.	Moves the payment evidence from Messenger history into a searchable business record.
Pending verification	New payment records remain pending until reviewed by Finance.	Stops unverified entries from immediately reducing the client balance.
Finance verification	Finance marks the entry Verified, Rejected, or Needs Clarification and can add notes.	Creates a clear approval step.
Verified balance update	Only verified payments affect the customer's amount paid and remaining balance.	Prevents accidental or fraudulent balance changes.
Payment history	Authorized staff and the customer can view appropriate historical payment entries.	Improves transparency and dispute handling.
Audit trail	Store verifier, timestamp and key changes.	Shows who approved or changed a money-related record.

BIR boundary: The system may generate a "Billing Statement" or "Statement of Account" before payment, and a "Payment Confirmation" after Finance verifies a payment. These are operational records only. The system should NOT claim to generate the client's official BIR invoice unless Fresh Phones PH later implements and validates a BIR-compliant invoicing setup with its accountant/legal adviser.

8 Employee Tasks, Deadlines & KPI

The task module can automate neutral facts such as whether a submission was on time or late. Consequential HR decisions should remain human-reviewed.

Feature	Recommended behavior	Why
Task creation	Authorized managers assign a task, instructions, priority, deadline and assignee.	Makes accountability and deadlines visible.
Employee updates	Employees update task status and submit reports/files.	Keeps work progress in one place.
Automatic timestamp	The system records the exact submission time.	Removes arguments about when work was submitted.
Late flag	The system automatically labels the submission On Time or Late based on the deadline.	Automates an objective fact without making an HR decision.
KPI review queue	Late or flagged items appear for the KPI/HR reviewer.	Helps management focus on items needing review.
Manual evaluation	KPI/HR reviews context and manually records the evaluation/recommendation.	Keeps consequential employment decisions with authorized people.
Approval trail	Any approved HR/payroll action records reviewer, reason and date.	Creates accountability and documentation.

KPI / late-flag disclaimer. The On-Time/Late flag is a factual record only and must not be used as the sole basis for any disciplinary or wage action; consequential decisions require separate human review under Fresh Phones PH's written policy.

**OLD /
REMOVE**

~~The system calculates a suggested salary deduction percentage based on configurable company rules.~~

REVISED

The system flags lateness and gives the KPI/HR officer the evidence. Any salary deduction or employment consequence is decided and entered manually only after Fresh Phones PH confirms its written policy and legal/labor compliance.

WHY

Automatic wage-deduction recommendations create unnecessary legal and privacy risk. Philippine wage deductions are restricted, so the software should not invent or enforce deductions by itself.

9 Reporting & Analytics

Reports should summarize authorized operational data without exposing private information to people who do not need it.

Feature	What the user can do	Why it is useful
Dashboard cards	Show counts such as active batches, verified payments, pending verification, open concerns and late tasks.	Gives management a quick health check.
Date filters	Filter reports by day/week/month/custom range.	Makes period comparisons easier.
Batch and payment reports	Summarize membership, collections, balances and statuses.	Helps operations and Finance reconcile records.
Task/KPI reports	Show task completion, lateness and review status.	Supports management follow-up.
Customer service metrics	Show open/closed issues, categories and turnaround time.	Identifies recurring service problems.
Exports	Allow authorized PDF/Excel/CSV exports where genuinely needed.	Supports offline reporting and management meetings.
Historical reports	Preserve prior reporting periods and submitted analysis.	Avoids losing historical context when new reports are added.

10

Customer Service

Customer concerns should be tracked as cases rather than disappearing in chat history.

Feature	What the user can do	Why it is useful
Create concern	Record category, description, client, date and source.	Creates a trackable record.
Assign staff	Assign a concern to the responsible CS employee.	Clarifies ownership.
Status tracking	Open, In Progress, Waiting for Client, Resolved, Closed.	Shows what still needs action.
Resolution notes	Record what was done and when.	Builds useful service history.
Recurring issue report	Group common categories and turnaround time.	Helps management improve operations.

11 Recruitment & Agent Verification

These public-facing features should collect or reveal only what is necessary.

Feature	What the user can do	Why it is useful
Careers list	Publish approved job openings.	Gives applicants an official place to check vacancies.
Application form	Collect only necessary applicant details and approved attachments.	Centralizes applications while applying data minimization.
Recruitment status – internal	HR can review and update applicant status.	Reduces manual tracking.
Agent verification	Public users can confirm an agent using an approved identifier/name.	Helps clients verify legitimacy.
Privacy-limited public result	Show only safe fields such as agent name, masked/ approved agent ID and Active/Inactive status.	Verifies the agent without exposing address, phone, IDs or private records.

12 Notifications

Notifications should support operations, but Messenger integration is not required for Version 1.

Feature	What the user can do	Why it is useful
In-app notifications	Show alerts inside the portal.	No extra external messaging cost for basic alerts.
Email notifications	Send account, task, verification, support and status emails through the configured email service.	Provides a reliable out-of-app alert channel.
Deadline reminders	Notify employees before and after task deadlines based on agreed rules.	Reduces missed submissions.
Finance alerts	Notify Finance of pending records and relevant staff of verification results.	Speeds up payment recording.
Customer status alerts	Notify customers when relevant statuses change.	Reduces manual follow-ups.
Configurable templates	Authorized admin can manage approved message templates/timing.	Keeps wording consistent.

13 AI Assistant & Automation

The system includes a workflow-aware AI assistant layered on top of the stable core (records and verified payments). The AI is assistive only: it summarizes, reminds and suggests, but never acts on its own and never replaces a human verification or decision step. It is implemented only after the core workflows and permissions are stable.

AI feature	What it does	Policy safeguard
Workflow understanding	Understands the Fresh Phones PH workflow using approved internal knowledge/instructions.	Uses only approved sources; no access beyond the requesting role's permissions.
Deadline reminders	Reminds assigned employees before task deadlines.	Assistive only; does not change deadlines or tasks.
Authorized notifications	Sends authorized email/in-app notifications to responsible personnel.	Only pre-approved templates and recipients; no autonomous outreach.
Overdue task summaries	Identifies overdue tasks and summarizes them for the KPI Officer/management.	Surfaces facts only; the human KPI/HR officer decides.
Task assistance	Assists employees in understanding assigned tasks and internal processes.	Explains only; cannot reassign, approve or complete work.
Report summarization	Summarizes submitted reports and surfaces operational patterns.	Read-only summarizing; does not alter records.
Deduction / action suggestions	Suggests actions or a deduction percentage based on configured company policy. The suggestion enters the KPI/HR review queue.	Suggestion only. A human must review, edit and approve before anything is recorded; the AI never applies a deduction or acts on wages itself.

AI guardrails (apply to every feature above): the AI respects role permissions and sees only what the requesting role may see; it must not independently approve or apply payroll deductions, alter financial records, or expose confidential data; all consequential HR/finance decisions require human review; and it operates in a privacy-aware manner consistent with NPC rules on automated decision-making/profiling.

14 Privacy, Documents & Compliance

This system handles personal information and sensitive documents. Privacy must be designed into the system from the beginning, not added after launch.

Requirement	Plain-language meaning	Owner
Privacy Notice	Fresh Phones PH provides a clear notice explaining what information is collected, why, how it is used, who receives it, retention, and data-subject rights.	Client/DPO/lawyer prepares or approves; developer implements the screens/links.
Terms & Conditions	Defines portal use, account responsibilities and business rules.	Client/lawyer approves; developer implements acceptance/version tracking if required.
Employee/Applicant Privacy Notice	Separate or appropriate notice for employee/KPI/payroll and recruitment information.	Needed because employee/applicant data has different purposes from customer data.
Data Processing Agreement	Agreement between Fresh Phones PH and developer/service providers when personal data is processed on behalf of the business.	Defines confidentiality, security, purpose, incident handling and deletion/return expectations.
DPO / privacy owner	Fresh Phones PH designates the person responsible for privacy compliance.	The developer should not silently become the client's legal privacy officer.
Privacy Impact Assessment	Document the data lifecycle, risks, access and controls before production.	Helps identify unnecessary collection and security risks.
NPC registration / exemption assessment	Client DPO/lawyer determines whether DPS/DPO registration is mandatory or an exemption route applies.	A lawyer-reviewed policy does not automatically replace NPC registration requirements.
Retention rules	Define how long IDs, payment proofs, applications, inactive accounts and employee records are kept.	Avoids keeping sensitive data forever.
Breach/incident process	Define who is contacted and what happens if private data is exposed or accessed incorrectly.	Required for responsible incident response.

Developer responsibility: implement the agreed technical controls such as authentication, permissions, private storage, logs, retention/deletion capability and secure deployment.

Client responsibility: determine lawful purposes/bases, approve notices and policies, appoint the DPO/privacy owner, decide NPC registration/exemption with counsel, and provide lawful HR/payroll rules.

15 Technical Architecture

Revision 1.5 | September 7, 2026 | TypeScript and live updates

The web interface and backend will use TypeScript. TypeScript checks code types during development; a separate live-update connection keeps open screens current. This revision replaces §15 of Revision 1.4 and adds §15.1–§15.2 to the full scope.

Production stack

Component	Technology and responsibility
Web interface	Next.js, React and TypeScript on Vercel: public website, customer portal and employee screens.
Backend / API	NestJS and TypeScript on Railway: permissions, business rules, validation, payment verification and live-update delivery.
Database	Supabase PostgreSQL with Prisma for data access and versioned database changes. Verified records remain the source of truth.
Authentication and files	Managed authentication and private Supabase Storage; the API checks account permissions and authorizes temporary file access.
Live updates	Authenticated Server-Sent Events (SSE) from the Railway API to the browser. Normal API requests handle submissions and edits.
Email and domain	Resend for transactional email; Cloudflare for domain/DNS and agreed routing. Email delivery is separate from browser updates.
Optional infrastructure	Redis is added only when measured queue, caching or delivery needs justify it. Multiple API instances must share change events.

System flow

Customer / employee browser → Next.js interface → NestJS API → Supabase database and private storage.

After a successful database commit, the API sends an authorized change event → the relevant open screen retrieves its latest permitted data.

Development requirements

Use strict TypeScript for frontend and backend, typed API contracts, and server-side input validation. Store money as decimal values; calculate balances from verified payments. Type checking does not replace permission checks, validation or workflow tests.

The existing Django backend is a migration reference. Replace it in tested stages, retaining each working workflow until the TypeScript replacement passes equivalent behavior and permission checks. This document specifies planned delivery, not completed implementation.

Technical reference: [TypeScript Handbook](#).

15.1 Real-Time Updates

Included behavior: relevant open screens update automatically after an authorized change is saved. Users should not need to reload the page to see these changes.

Area	What updates automatically
Finance verification	Finance sees newly recorded payments in its pending queue. Authorized staff see saved verification decisions.
Customer payments	The affected customer's verified payment history, amount paid and remaining balance refresh after Finance verification. Pending or rejected entries do not reduce the balance.
Client and batch records	Authorized users see saved membership, requirements-review and release-status changes relevant to the screen they are viewing.
Tasks and KPI	Assigned employees and authorized reviewers see saved assignment, deadline, submission and review-status changes. Lateness remains a factual flag; consequential decisions remain human-reviewed.
Customer support	The customer and authorized CS staff see saved case-status, assignment and resolution changes within their access permissions.
Notifications and dashboards	Relevant in-app alerts, unread counts and affected operational summary cards refresh. Historical reports and exported files retain their existing reporting behavior.

Example: a verified payment

1. Staff records a payment made through the existing external channel.
2. Finance reviews and verifies it. The system commits the verification and audit record.
3. The customer's open portal and permitted staff screens receive a change notice and retrieve updated records. The balance reflects the verified payment once.

Connection behavior

The interface shows when live updates are reconnecting or unavailable. It reconnects automatically and fetches current data after reconnecting or returning to the page. A refresh control remains available, with periodic refresh as a fallback while live delivery is unavailable.

Live updates cover active browser sessions. Closed or suspended browsers catch up when reopened. Email follows §12; browser push, chat and collaborative editing are not added by this revision.

SSE supports server-to-browser updates over HTTP. See [NestJS SSE documentation](#) and [MDN connection behavior](#).

15.2 Controls and Acceptance

Delivery and access controls

- **Committed changes only.** Send events after the database transaction succeeds. A failed or rolled-back save must not appear as a successful update.
- **Permission-scoped delivery.** Authenticate each connection and check current role and record access before delivery. Customers receive only their own permitted events. Confidential HR information and private documents never enter public or broadly shared feeds.
- **Session lifecycle.** Stop delivery when the session expires, the user logs out, or access is revoked. Reconnection requires valid authorization. Never place reusable credentials in event URLs.
- **Minimal event content.** Send only the identifiers needed to refresh an authorized view. The API authorizes the subsequent data request again; events must not contain identity documents, private file links or unnecessary personal data.
- **Recovery and consistency.** Duplicate, missed or out-of-order events must not change stored balances or create duplicate actions. Refetch authoritative data after connection gaps; preserve unsaved form input and surface conflicting edits.
- **Deployment readiness.** Verify streaming through production hosting/proxies, connection limits and heartbeats. If the API runs on multiple instances, use shared event delivery so users connected to another instance still receive changes.

Acceptance checks added to §21

Check	Expected result
Two open sessions	A saved change appears on the relevant second screen without a manual page reload. Proposed UAT target: within 5 seconds under an agreed test load and normal connectivity.
Payment correctness	Pending, rejected, failed and rolled-back payments leave the balance unchanged. Verified payments affect the derived balance once, including repeated or concurrent verification attempts.
Access isolation	Another customer, an unrelated employee and an unauthenticated browser receive no restricted events or records. Expired or revoked access stops delivery.
Connection recovery	Disconnect and reconnect a browser; the stale-state indicator appears and the screen catches up, including changes missed during the gap.
User work and deployment	Background updates preserve unsaved input. Supported mobile/desktop browsers, fallback refresh and the deployed API topology pass the same checks.

Delivery planning

Build live updates alongside the corresponding operations modules; verify them during hardening and UAT. Finalize concurrent-user assumptions and the proposed latency target during discovery. This is not a 24/7 availability or latency SLA. Existing commercial terms and dated subscription estimates in §20 are retained; assess hosting usage and any delivery changes through the existing change-control process.

16

Security Requirements

These controls are considered part of a proper production system, especially because IDs, financial records and employee data are involved.

Feature	What the user can do	Why it is useful
Secure authentication	Use managed authentication, secure sessions and password reset flows.	Protects user accounts.
Backend role checks	Important permissions are checked on the server/ database, not only by hiding buttons.	Prevents users from bypassing the interface.
Private file storage	Sensitive files are private; access is authenticated/ authorized and temporary where possible.	Prevents public ID/document links.
HTTPS	Encrypt traffic between user and system.	Protects information while it travels over the internet.
Audit logs	Log sensitive changes such as role changes, payment verification and record edits.	Supports accountability.
Validation and rate limiting	Validate submitted values/files and limit abusive request patterns.	Reduces common attacks and misuse.
Backups and recovery	Maintain managed backups and a recovery approach.	Reduces risk of losing business records.
Secrets management	Keep database/admin/API secrets only in secure server environment variables.	Prevents credentials from leaking into the frontend or source code.
Least privilege	Give each role only the access necessary for its job.	Reduces accidental and intentional exposure.

17 SDLC & Estimated Timeline

Estimated delivery for the revised complete core system is approximately 4–6 months. The reason is that the project is not only “coding a website”; it follows a proper Software Development Life Cycle (SDLC) so requirements, security, testing and handover are handled before production.

Stage	What happens
Month 1 – Discovery & Design	Confirm workflows, roles, final requirements, privacy boundaries, database structure, UI/UX wireframes/prototype and acceptance criteria.
Month 2 – Core Foundation	Authentication, roles/permissions, public site foundation, employee/customer accounts, batch and client records.
Month 3 – Operations	Payment recording/Finance verification, documents, customer portal status, tasks/deadlines and support module.
Month 4 – Management	KPI review workflow, reports/analytics, recruitment, agent verification, notifications and audit logs.
Month 5 – Testing & Hardening	Permission tests, security checks, workflow tests, mobile responsiveness, report validation, bug fixing and data/privacy review.
Month 6 – UAT & Launch Buffer	Client user acceptance testing, agreed revisions, production deployment, documentation, training and handover. Can be shorter if earlier stages finish cleanly.

Timeline rule: new features or major workflow changes after scope sign-off may extend the timeline and should be treated as a change request rather than unlimited revisions.

18 Scope Revisions – What Changes and Why

The following items from the initial requirements should be changed before development. This is the main “redline” section for client discussion.

1. Payments / billing records

**OLD /
REMOVE**

~~System handles payments/receipts and may decide whether a gateway is required.~~

REVISED

Clients pay through Messenger/external channels. The system may show a Billing Statement / Statement of Account for dues, then records the payment and Finance verification afterward.

WHY

Matches the confirmed real workflow and avoids unnecessary payment integration.

2. Billing statement vs official BIR invoice

**OLD /
REMOVE**

~~Customer portal may “view receipts” or use invoice-like wording for normal account records.~~

REVISED

Use “Billing Statement” / “Statement of Account” to show amounts due and “Payment Confirmation” after Finance verification. The official BIR invoice remains outside this V1 system unless separately implemented and validated.

WHY

A billing statement is appropriate for showing what the customer owes without presenting the document as the official BIR sales invoice.

3. Automatic salary deduction suggestion

**OLD /
REMOVE**

~~System calculates a suggested percentage deduction from configured rules.~~

REVISED

System only flags lateness/objective facts. KPI/HR manually evaluates and records any approved action.

WHY

Reduces labor-law and automated-decision risk.

4. AI deduction suggestions

**OLD /
REMOVE**

~~AI may independently suggest or apply deduction percentages.~~

REVISED

AI may suggest a deduction percentage from configured company policy as a proposal only. It enters the KPI/HR review queue and must be human-reviewed and approved before anything is recorded; the AI never applies deductions itself (see §13).

WHY

Keeps the assistive value while keeping consequential HR decisions human-controlled.

5. AI layer

**OLD /
REMOVE**

~~AI deferred entirely to a separate future phase.~~

REVISED

AI is included in this scope as an assistive layer (see §13), built on top of the stable core and governed by the AI guardrails.

WHY

Delivers AI value while the guardrails prevent it from complicating or compromising the core release.

6. Redis as required infrastructure

**OLD /
REMOVE**

~~Cache layer may be assumed as part of production stack.~~

REVISED

Redis is optional and added only if queue/cache/rate-limiting needs justify it.

WHY

Keeps the initial architecture simpler and cheaper.

7. Broad employee access

**OLD /
REMOVE**

~~Management roles could be interpreted as broad access to all records.~~

REVISED

Use least-privilege permissions and separately authorize confidential payroll/KPI/customer documents.

WHY

Reduces privacy exposure.

8. Public agent details

OLD /
REMOVE

~~Agent verification could reveal too much agent information.~~

REVISED

Public result shows only approved name/identifier and active/inactive verification status.

WHY

Verifies legitimacy without publishing private employee/agent data.

9. Privacy as a security bullet only

OLD /
REMOVE

~~Privacy is mentioned but not a full workstream.~~

REVISED

Add Privacy Notice, employee/applicant notices, DPA, PIA, retention, DPO and NPC registration/exemption review as pre-launch client obligations.

WHY

The system collects IDs, financial and employee data, so privacy affects the entire design.

10. Original budget guidance

OLD /
REMOVE

~~Initial document contains large planning estimates unrelated to the agreed commercial discussion.~~

REVISED

Remove those planning estimates from the functional scope. Final development commercial terms are agreed separately.

WHY

Prevents confusion between an early planning estimate and the actual developer-client agreement.

19 Out of Scope / Future Phase

The following are not included in the revised first production scope unless separately approved and quoted:

- Online checkout or direct website payments (Stripe, PayMongo, Maya gateway, etc.)
- BIR POS/CAS registration work or generation of official BIR tax invoices from this system
- Automatic salary deductions or automated disciplinary decisions
- Native Android/iOS mobile apps; the included product is a mobile-responsive web system
- Full payroll computation engine unless separately specified
- SMS credits or paid Messenger API integration unless separately scoped
- Large historical data cleaning/migration beyond an agreed import template/volume
- Advanced BI/data warehouse implementation
- Unlimited revisions or features added after final scope sign-off
- 24/7 managed operations/support unless a maintenance SLA is purchased

20 Commercial & Subscription Boundaries

Why this investment

This is a system, not a website. The build covers roughly nine functional modules — Paluwagan records, payment recording & Finance verification, employee tasks/KPI, reporting, customer service, recruitment/agent verification, notifications, the customer portal, and the public site — plus a policy-bound AI assistant layer and cross-cutting security and privacy controls. Because it handles government IDs, financial records and employee data, it follows a proper Software Development Life Cycle (discovery → build → testing → UAT → handover), not “coding a page.”

The bigger recurring number. Running the system costs approximately PHP 3,068/month (~PHP 36,815/year) in third-party subscriptions — paid by Fresh Phones PH, and each year that recurring operating cost is larger than the one-time development fee.

What keeps the price focused. Version 1 deliberately excludes the most expensive items — online payment processing, BIR invoice generation, native mobile apps and automatic salary deductions — each available later as a separately quoted phase (see §19). The development fee reflects a focused, records-first V1, not the full market cost of the effort involved.

The agreed development price is a one-time project fee starting at **PHP 40,000**, subject to final signed scope. Operating subscriptions are separate and continue to be paid by Fresh Phones PH while the system is running.

Item	Treatment	Notes
Development	One-time project fee	One-time development fee starting at PHP 40,000, subject to final signed scope. Any added or changed work is separately agreed.
Vercel / hosting	Recurring subscription/usage	Recommended production plan: Vercel Pro at USD 20/month (about PHP 1,227/month at the reference FX rate). Actual usage or additional paid seats may add cost.
Railway / backend	Recurring subscription/usage	Railway Hobby starts at USD 5/month and includes USD 5 of resource usage (about PHP 307/month minimum). Usage above the included amount is billed separately.
Supabase	Recurring subscription/usage	Supabase Pro starts at USD 25/month (about PHP 1,534/month) for the production database, authentication, storage and included platform quotas.
Cloudflare / domain	Domain renewal and any paid services	Cloudflare DNS and basic Email Routing can remain on the Free plan. Domain registration/renewal is a separate annual cost that depends on the chosen TLD.
Resend / email	Recurring if usage exceeds free/included level	Resend Free: USD 0 for up to 3,000 emails/month. If needed later, Pro starts at USD 20/month (about PHP 1,227/month) for 50,000 emails/month.
Redis	Not required initially	Not included in the starting monthly total. Add only when caching, queues or rate-limiting requirements justify it; cost depends on actual usage/provider.

Item	Treatment	Notes
Maintenance	Separate after-launch agreement	Separate after-launch agreement. This is not part of the third-party subscription total and should be agreed independently.

Development fee payment schedule

The one-time development fee is paid in milestones. Peso amounts below are shown at the PHP 40,000 starting figure and adjust pro-rata to the final agreed fee:

Milestone	Share	Amount (at PHP 40,000)
Scope sign-off (before development begins)	30%	PHP 12,000
Prototype/design approval	20%	PHP 8,000
Core Foundation acceptance (auth, roles, accounts, batch & client records)	20%	PHP 8,000
Operations acceptance (payment recording/verification, customer portal, tasks)	20%	PHP 8,000
UAT sign-off and handover	10%	PHP 4,000
Total	100%	PHP 40,000

Alternative on agreement: 50% on scope sign-off / 50% on UAT sign-off and handover — PHP 20,000 / PHP 20,000 at the starting figure.

Estimated Subscription Total (Planning Reference)

Scenario	Estimated total
Baseline monthly	USD 50 / about PHP 3,068 per month
Baseline annual	About PHP 36,815 per year + domain renewal
If Resend Pro is needed	USD 70 / about PHP 4,295 per month
Suggested operating allowance	Plan around PHP 3,500–5,000 per month initially to allow for usage overages and provider changes.

Assumptions: one Vercel Pro production setup, Railway Hobby minimum, one Supabase Pro organization/project, Cloudflare Free DNS/Email Routing, Resend Free, and no Redis at launch. PHP estimates use USD 1 = PHP 61.358 (reference rate on August 14, 2026). Actual exchange rates, provider pricing and resource usage may change.

Recommended ownership: production domain, hosting, database, email and other third-party accounts should be owned and paid by Fresh Phones PH, with the developer receiving the access needed to build and maintain the system.

21 Acceptance, Handover & Change Control

Item	Definition
Scope sign-off	Both sides approve the final modules, roles, workflows and exclusions before full development.
Prototype approval	Key screens/workflows are reviewed before deep implementation.
Staging/UAT	Client receives a test environment or production-like test build for user acceptance.
Acceptance criteria	Each module is checked against the agreed behavior, permissions and required outputs.
Bug fixes	Defects against the signed scope are fixed during the agreed warranty/bug-fix period.
Change requests	New or materially changed features are documented, estimated and approved separately.
Handover	Provide production deployment, repository/access arrangement, basic admin/user documentation and credential/account ownership handover as agreed.
Maintenance	Ongoing updates, new features, monitoring or support after the warranty period are handled under a separate maintenance arrangement.

Warranty. A 3-month warranty period applies, starting from production deployment and handover acceptance. During this period, defects against the signed scope are fixed at no charge. New or materially changed features are treated as change requests and quoted separately. Maintenance, monitoring and support after the warranty period are covered by a separate agreement.

A

Recommended Data Fields

Exact fields should be finalized during discovery. Collect only what the business genuinely needs.

Data group	Suggested fields / principle
Customer	Customer ID, full name, contact details, approved address fields, batch, unit/model, status, created/updated dates.
Customer documents	Document type, status, private file reference, upload date, reviewer, review notes. Avoid unnecessary duplication of ID data.
Batch	Batch number, unit/model, status, start/end/key dates, assigned agent/handler, member links.
Payment	Client, batch, expected/due reference, amount, payment date, method, reference number, proof file if needed, verification status, verifier, verification date, notes.
Task	Title, instructions, assignee, creator, priority, deadline, status, submission timestamp, late/on-time flag, attachments.
KPI review	Task/period reference, reviewer, factual evidence, manual evaluation, recommendation/status, reason, approval/rejection, timestamps.
Support case	Client, category, description, assigned staff, status, date received, resolution, closed date, turnaround time.
Applicant	Only approved recruitment fields, position applied for, contact, attachments, status, reviewer notes.
Agent verification	Internal agent record plus a deliberately limited public verification view.
Audit log	Actor/user, action, record type/id, timestamp, relevant before/after summary where appropriate.

B

Compliance Reference Notes

These notes explain why several requirements were revised. Final legal interpretation belongs to Fresh Phones PH's professional advisers. References checked August 2026.

Data Privacy Act / NPC IRR

The system processes personal data, including customer IDs/documents and employee information. Fresh Phones PH should implement transparency, lawful processing, appropriate security and accountable processing.

National Privacy Commission – IRR of the Data Privacy Act of 2012: privacy.gov.ph/implementing-rules-regulations-data-privacy-act-2012/

NPC registration

NPC Circular 2022-04 sets mandatory registration triggers for covered PICs/PIPs and Data Processing Systems; the client DPO/lawyer should assess registration or the applicable exemption process.

privacy.gov.ph/pips-and-pics/faqs/ and privacy.gov.ph/pips-and-pics/register/

Automated decision-making/profiling

NPC registration rules specifically address automated decision-making/profiling, which is one reason to avoid automated salary-deduction recommendations in V1.

NPC Circular No. 2022-04

Breach response

NPC guidance includes time-sensitive notification duties for reportable personal data breaches.

privacy.gov.ph/pips-and-pics/breach-reporting/

BIR invoicing boundary

BIR EOPT rules govern official invoices and current sales-document requirements. This V1 system should use Billing Statements / Statements of Account for amounts due and Payment Confirmations for verified payments, while Fresh Phones PH handles its official BIR invoice through its approved process.

BIR Ease of Paying Taxes: bir.gov.ph/EOPT

Wage deductions

Philippine labor rules restrict deductions from wages, supporting the recommendation that the software should not automatically compute/enforce salary deductions.

Labor Code / Lawphil: lawphil.net/statutes/presdecs/pd1974/pd_442_1974.html

Final Scope Confirmation

Before development proceeds beyond discovery/design, both parties should confirm the final role matrix, payment workflow, Paluwagan workflow, customer document list, KPI review process, reporting requirements, privacy/legal documents, production account ownership, commercial terms, and out-of-scope list.

☐ I confirm Fresh Phones PH is responsible for appointing the DPO, approving privacy notices/policies, and assessing NPC registration/exemption with counsel. These are not absorbed into development scope.

This confirmation includes the TypeScript and real-time update requirements in sections 15-15.2.
